COMP5211: Machine Learning

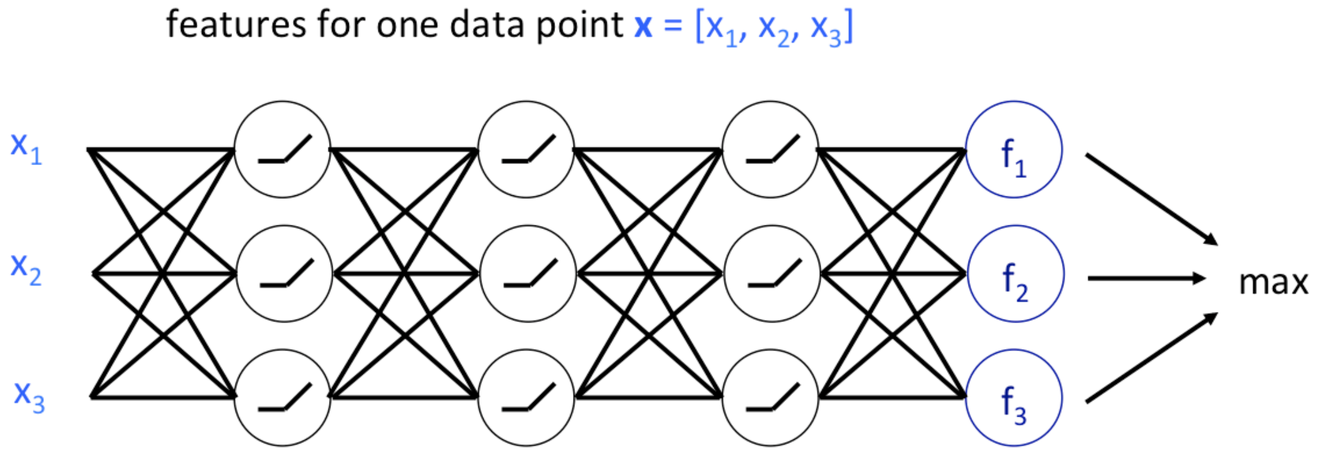
Lecture 13

Minhao Cheng

Neural Network

Multiclass Classification

- K classes: K neurons in the final layer
- Output of each f_i is the score of class i
  - Taking $\arg\max_i f_i(x)$ as the prediction



Neural Network

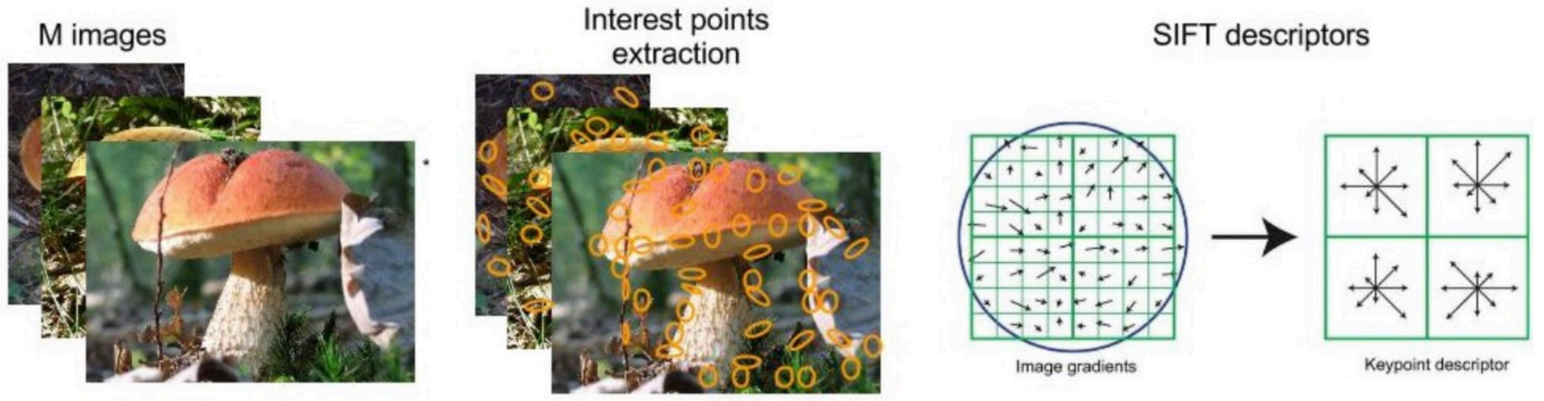
Multiclass loss

- Softmax function: transform output to probability:
  - $[f_1, \cdots, f_K] \rightarrow [p_i, \cdots, p_K]$
  - Where $p_i = \dfrac{e^{f_i}}{\sum_{j=1}^{K} e^{f_j}}$
- Cross-entropy loss:
  - $L = -\sum_{i=1}^{K} y_i \log(p_i)$
    - Where y_i is the i-th label

Convolutional Neural Network

Image classification without CNN

- Input an image
- Extract ``interesting points'' (e.g., corner detector)
- For each interesting point, extract 128-dimensional SIFT descriptor
- Clustering of SIFT descriptor to get ``visual vocabulary''
- Then transform image to a feature vector (bag of visual words)
- Run classification (SVM)

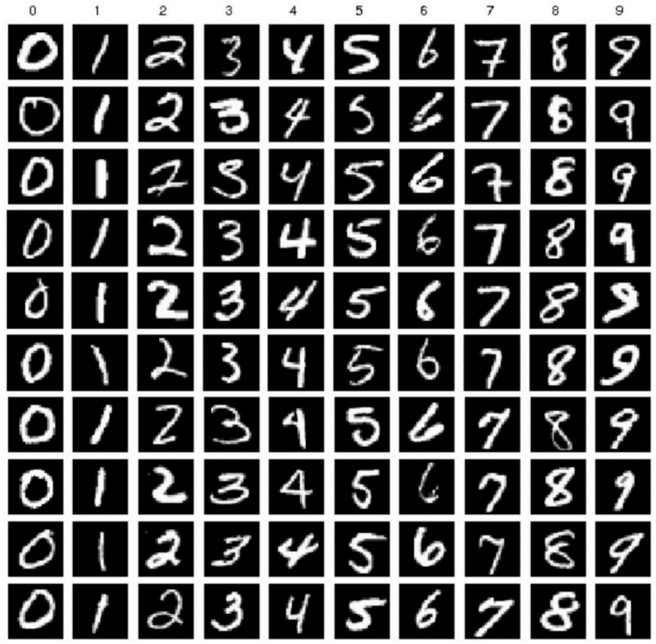


* Mushroom image by Tifred25 (http://commons.wikimedia.org/wiki/File:Bolet_Orange_01.jpg)

Dataset

MNIST

- Hand-written digits (0 to 9)
- Total 60,000 samples, 10-class classification



Dataset

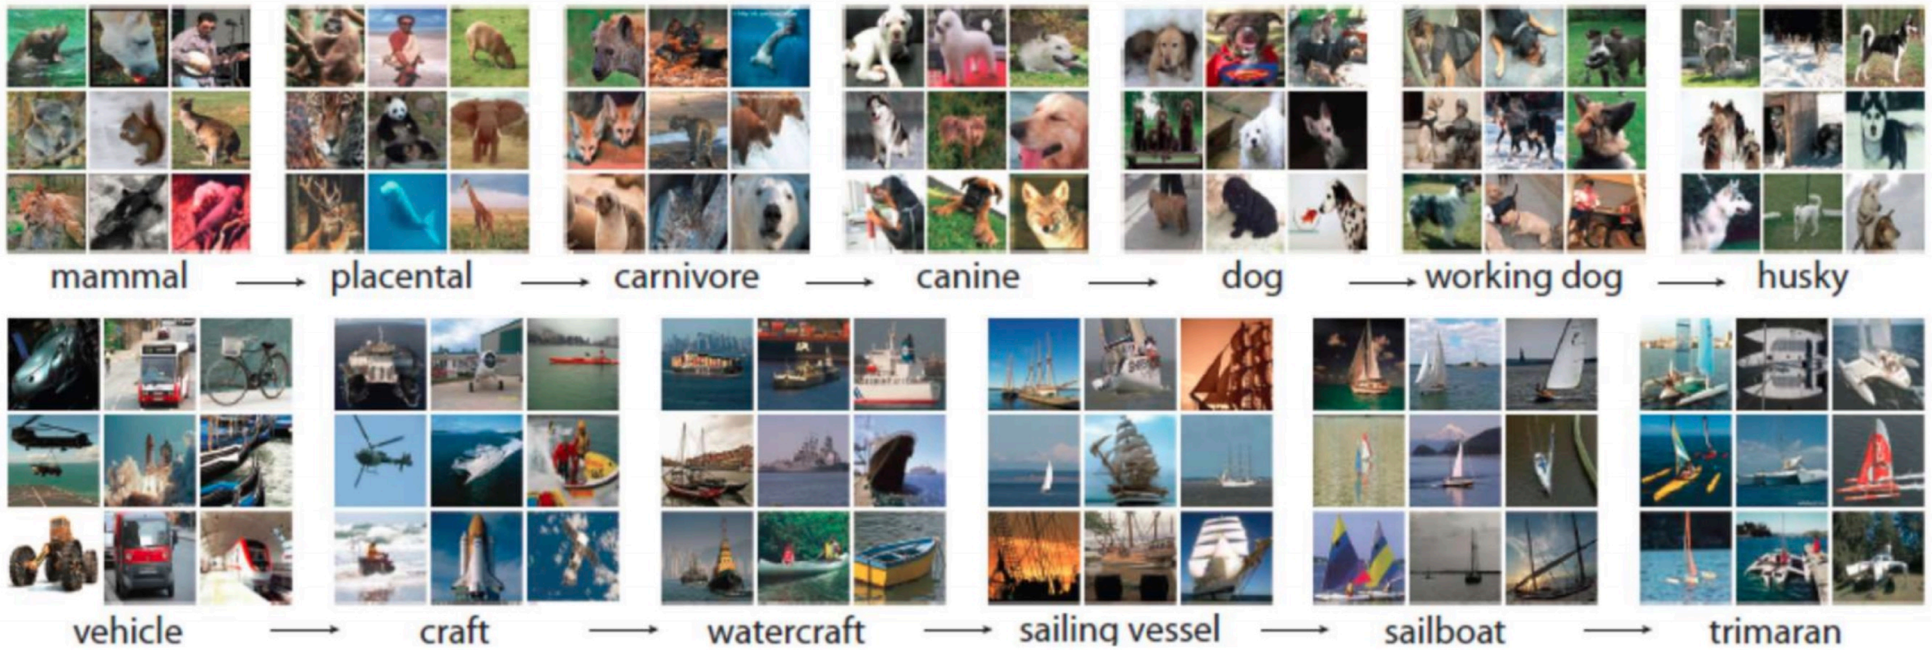
MNIST Classification Accuracy

- See the website by Yann LeCun: http://yann.lecun.com/exdb/mnist/

Classifier	Test Error
Linear classifier	12.0 %
SVM, Gaussian kernel	1.4%
SVM, degree 4 polynomial	1.1%
Best SVM result	0.56%
2-layer NN	$\sim$ 3.0%
3-layer NN	$\sim$ 2.5%
CNN, LeNet-5 (1998)	0.85%
Larger CNN (2011, 2012)	$\sim$ 0.3%

Dataset

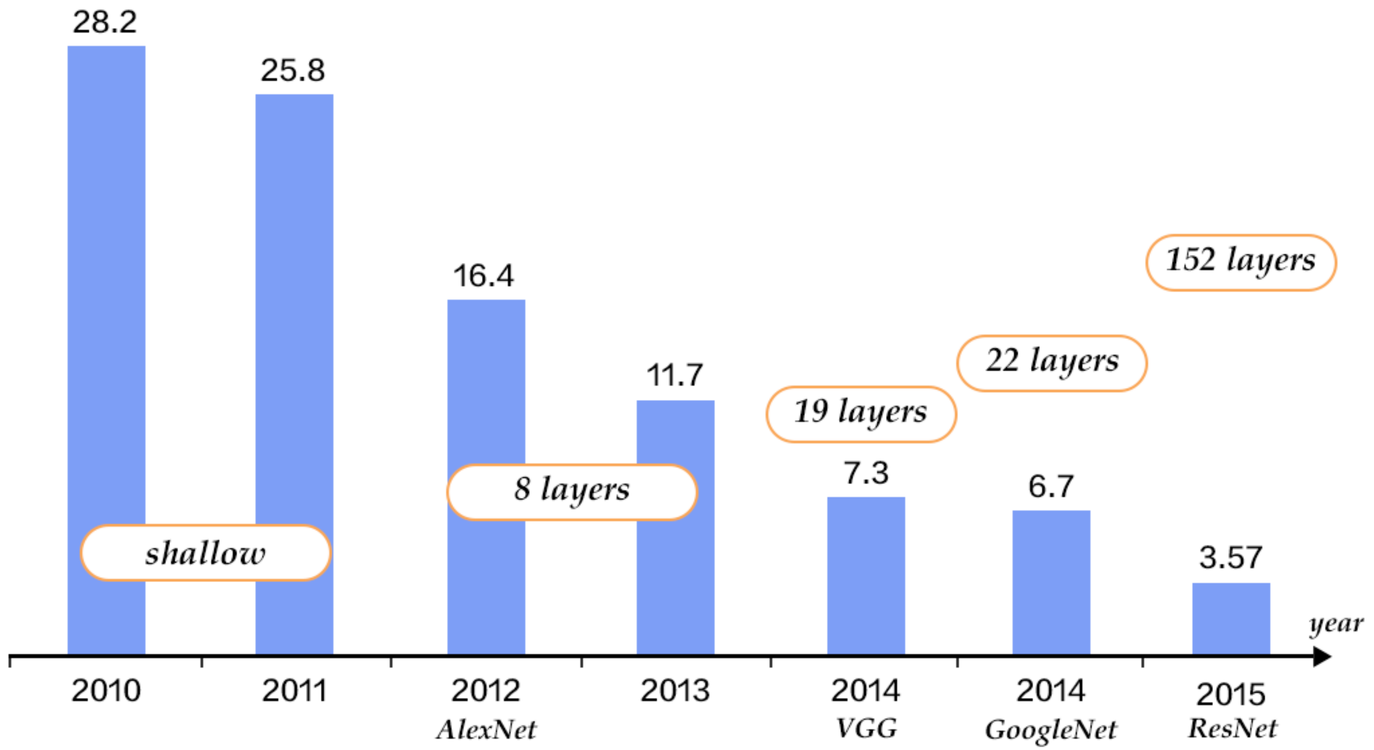
ImageNet Data



- ILSVRC competition: 1000 classes and about 1.2 million images
- Full imagenet: >20,000 categories, each with about a thousand images.

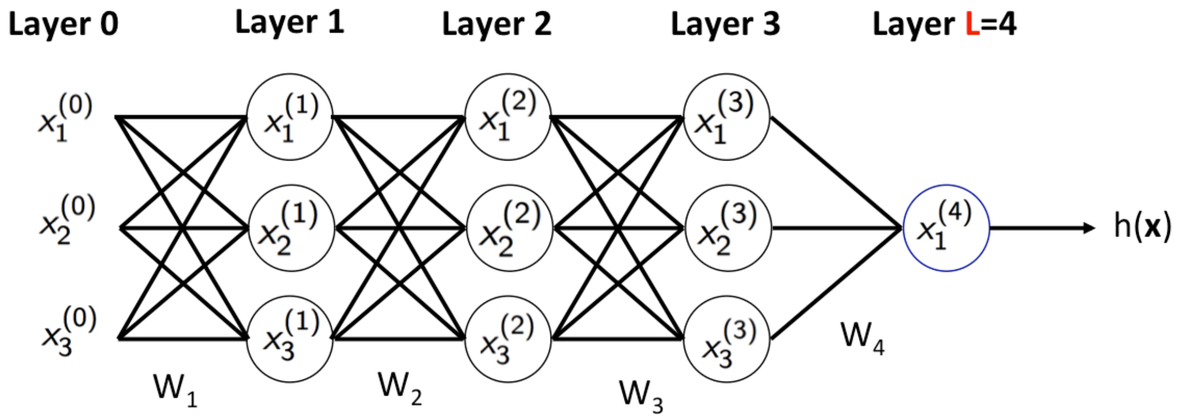
Dataset

ImageNet Results



Convolutional Neural Network

Neural Networks



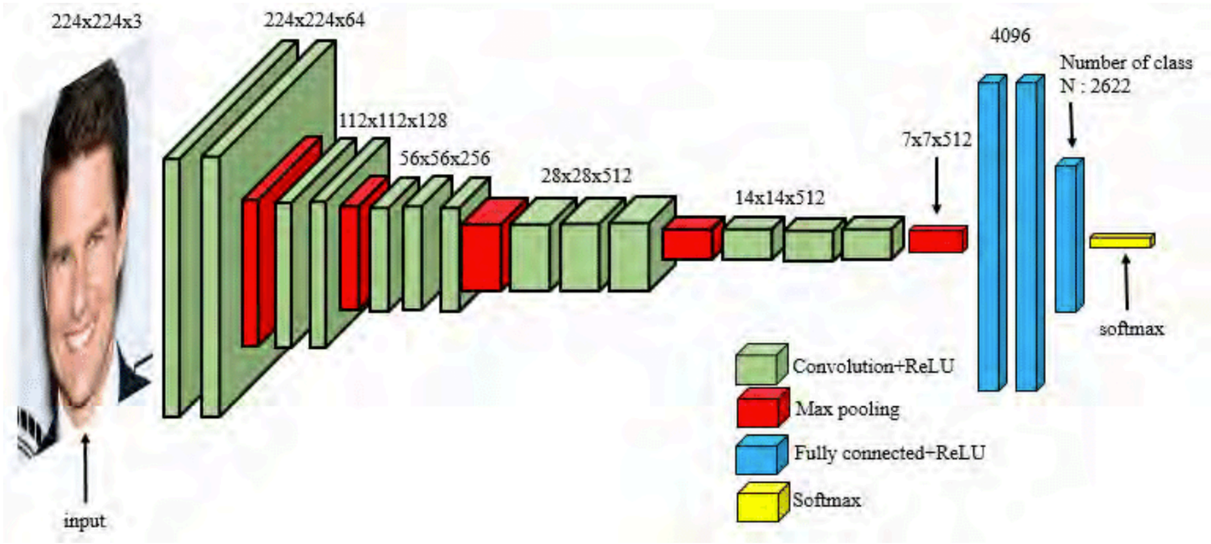
$$h(\boldsymbol{x}) = x_1^{(4)} = \theta(W_4 \boldsymbol{x}^{(3)}) = \theta(W_4 \theta(W_3 \boldsymbol{x}^{(2)}))$$
$$= \cdots = \theta(W_4 \theta(W_3 \theta(W_2 \theta(W_1 \boldsymbol{x}))))$$

- Fully connected networks ⇒ doesn't work well for computer vision applications

Convolutional Neural Network

The structure of CNN

- Structure of VGG



- Two important layers:
  - Convolution
  - Pooling

Convolutional Neural Network

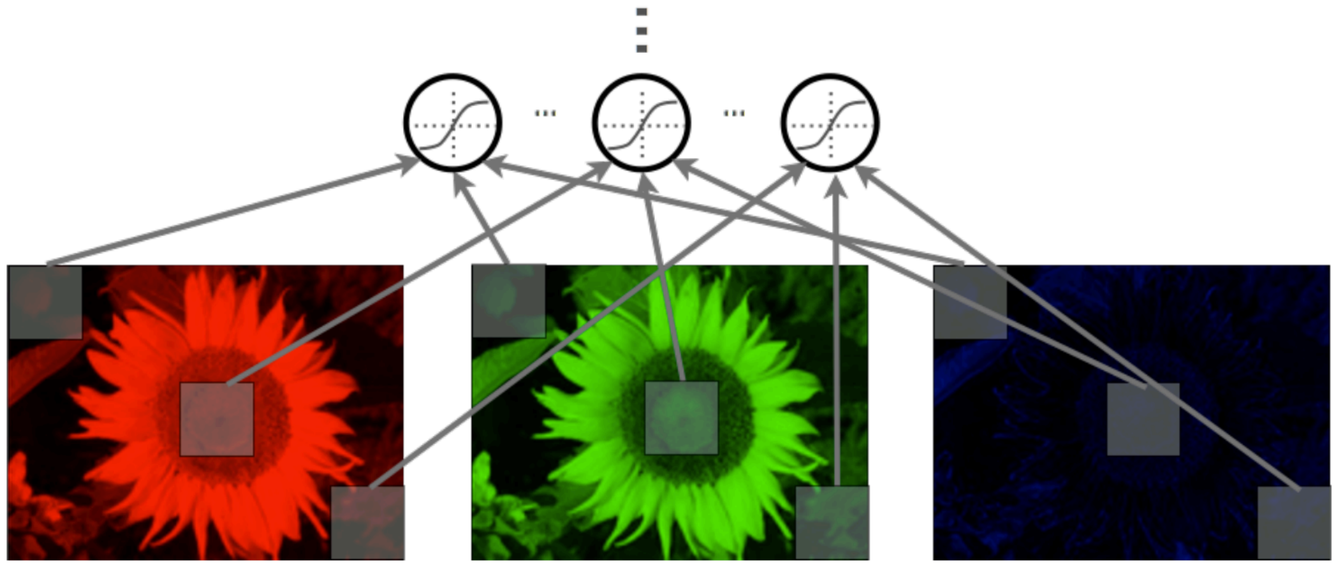
Convolution Layer

- Fully connected layers have too many parameters
  - $\Rightarrow$ poor performance
- Example: VGG first layer
  - Input: $224 \times 224 \times 3$
  - Output: $224 \times 224 \times 64$
  - Number of parameters if we use fully connected net:
    - $(224 \times 224 \times 3) \times (224 \times 224 \times 64) =$ 483 billion
  - Convolution layer leads to:
    - Local connectivity
    - Parameter sharing

Convolutional Neural Network

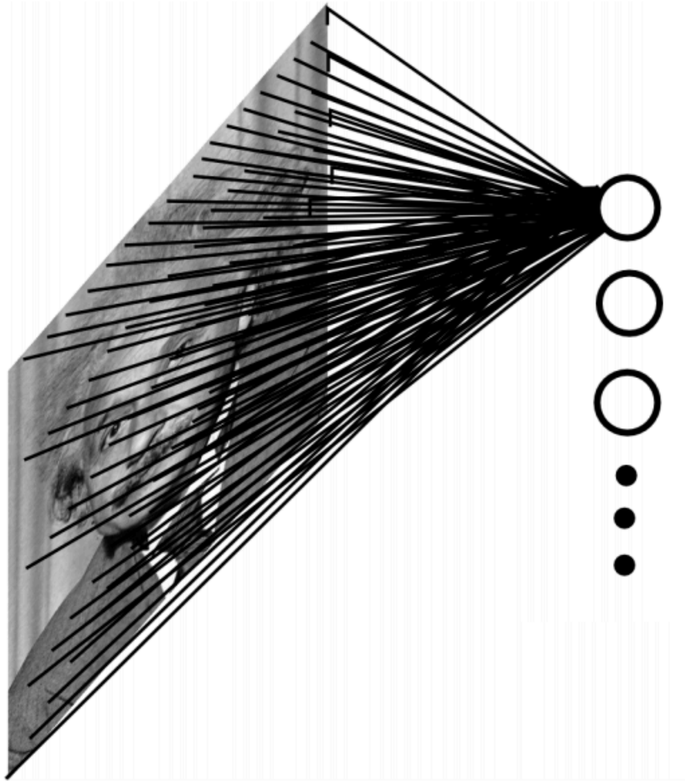
Local connectivity

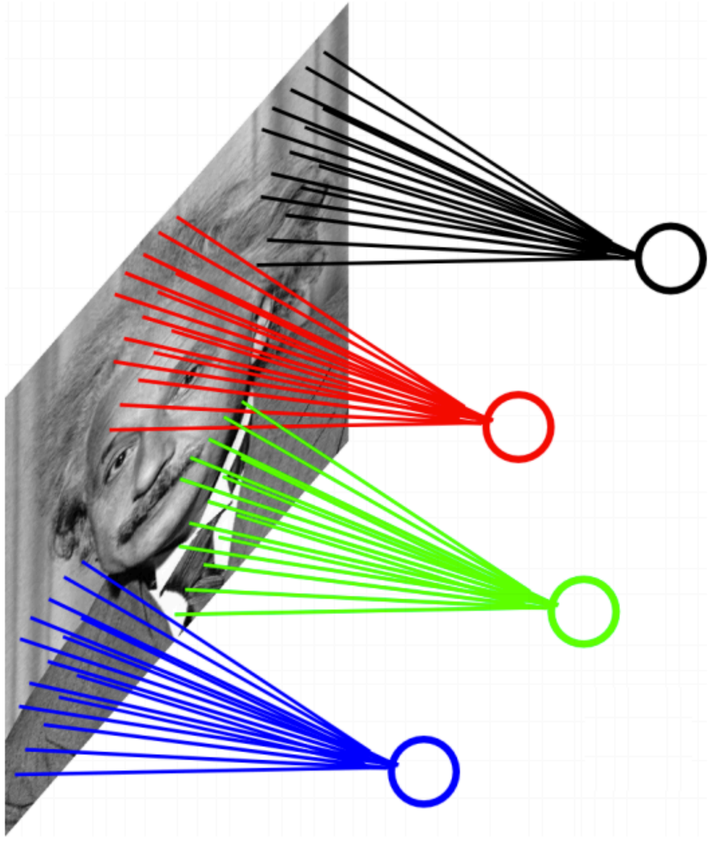
- Each hidden unit is connected only to a sub-region of input
- It is connected to all channels (R, G, B)



Convolutional Neural Network

Local connectivity





Convolutional Neural Network

Parameter Sharing

- Making a reasonable assumption:
  - If one feature is useful to compute at some spatial position (x, y),
  - then it should also be useful to compute at a different position (x_2, y_2)
- Using the convolution operator

Convolutional Neural Network

Convolution

- The convolution of an image x with a kernel k is computed as
  - $(x * k)_{ij} = \sum_{pq} x_{i+p,j+q} k_{p,q}$

1	0.5	20

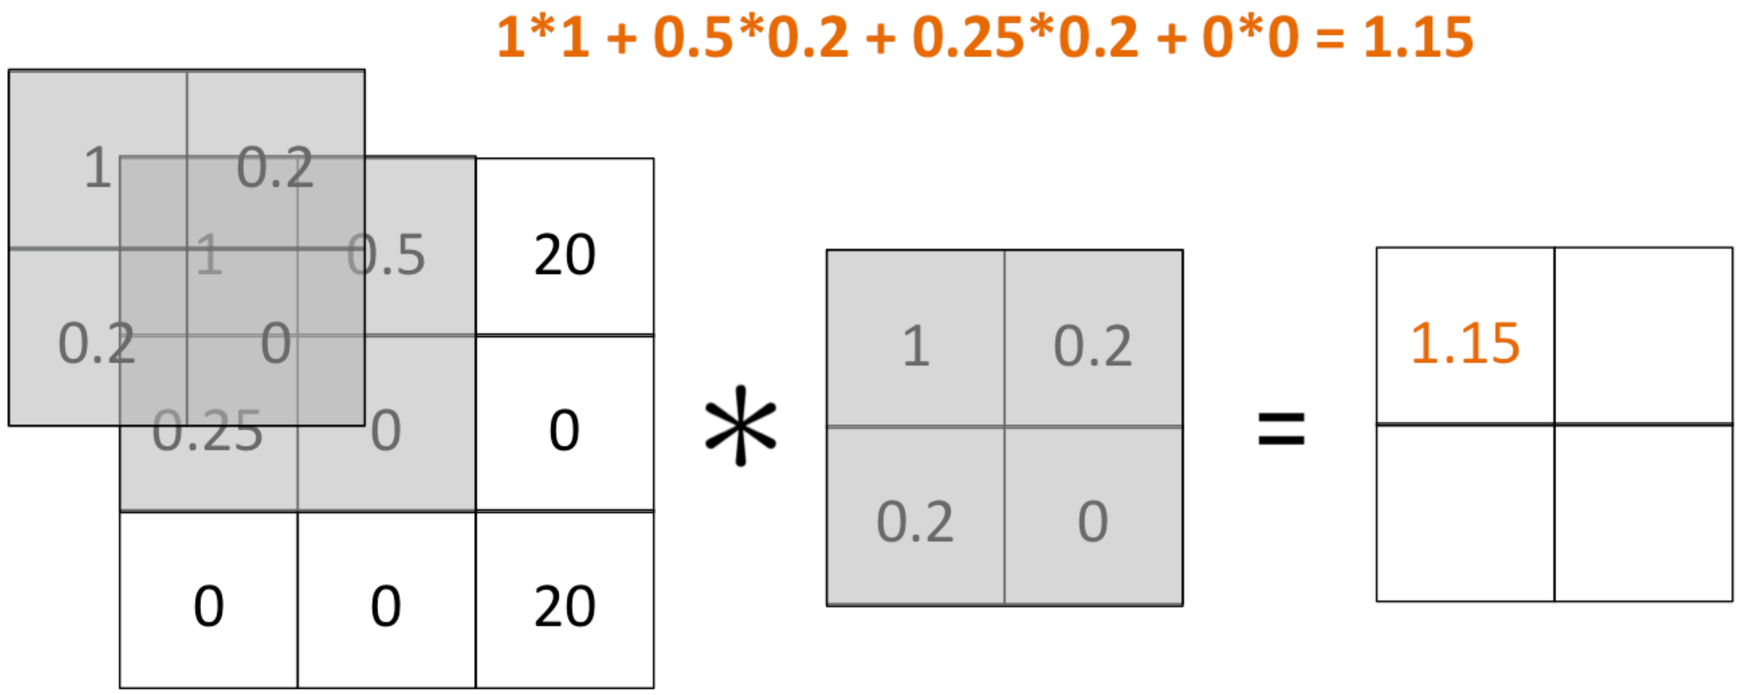
0.25	0

$=$

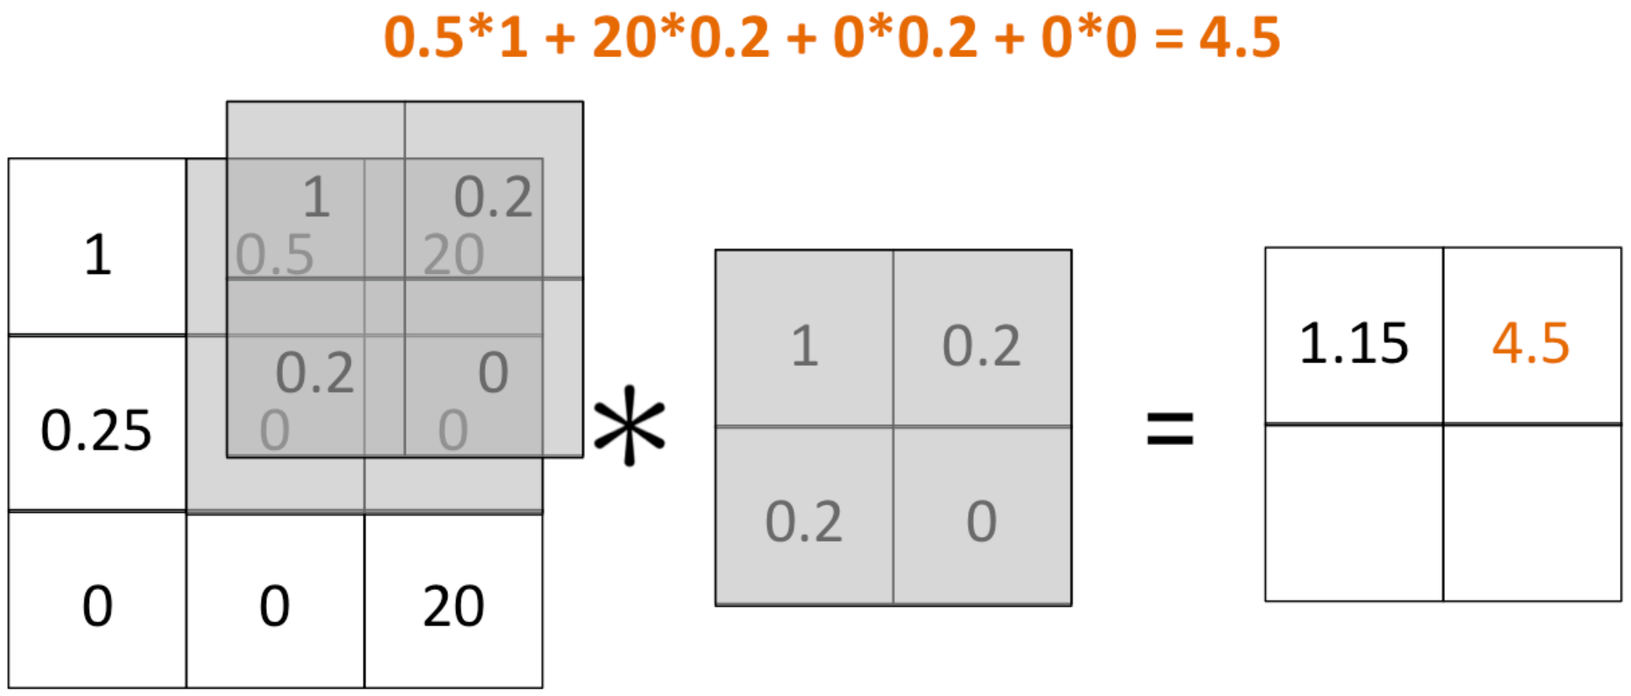
Convolutional Neural Network

Convolution



Convolutional Neural Network

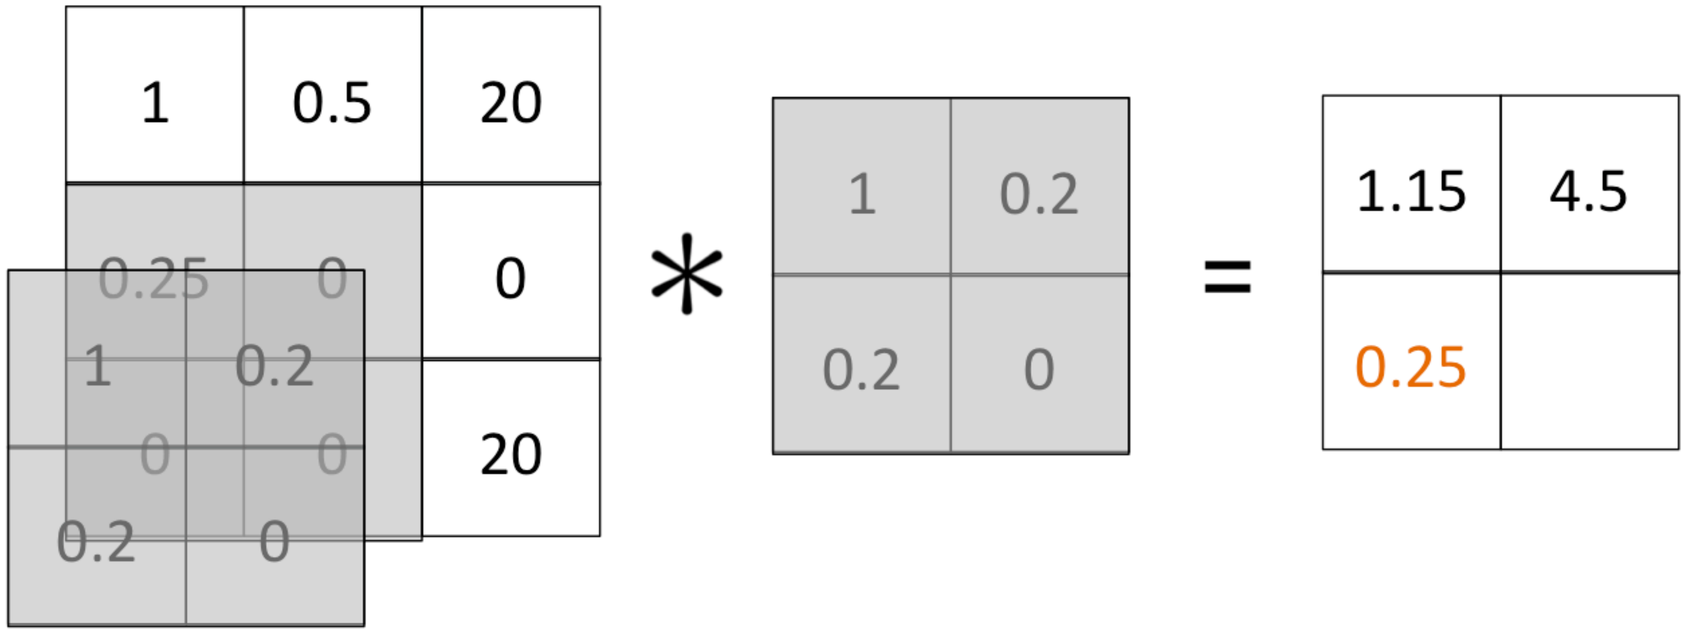
Convolution



Convolutional Neural Network

Convolution

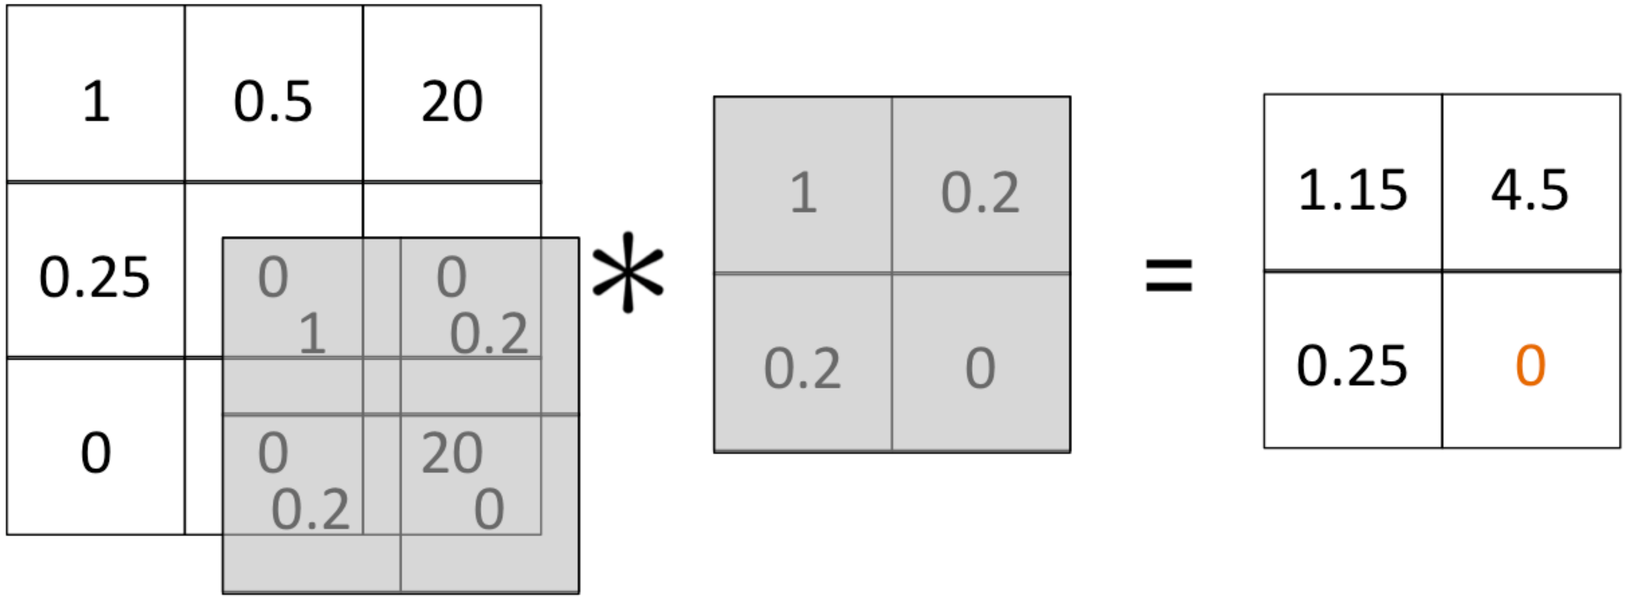
$$0.25*1 + 0*0.2 + 0*0.2 + 0*0 = 0.25$$



Convolutional Neural Network

Convolution

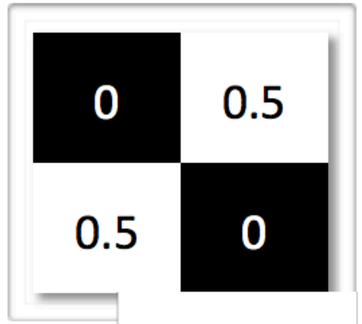
$$0*1 + 0*0.2 + 0*0.2 + 20*0 = 0$$

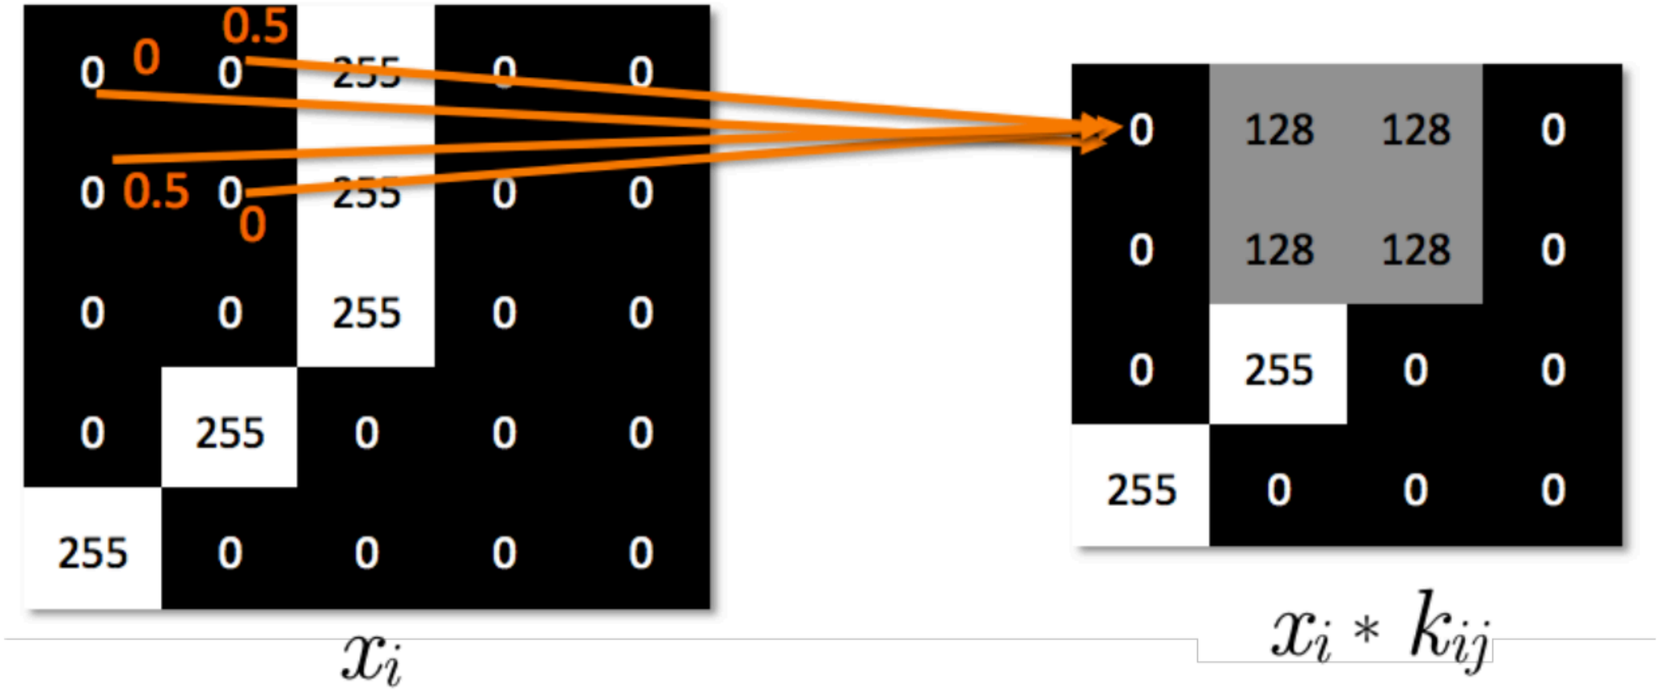


Convolutional Neural Network

Convolution

$$x * k_{ij}, \quad \text{where } W_{ij} = \tilde{W}_{ij}$$



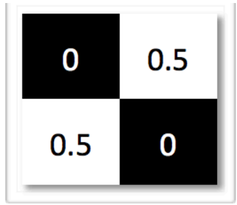


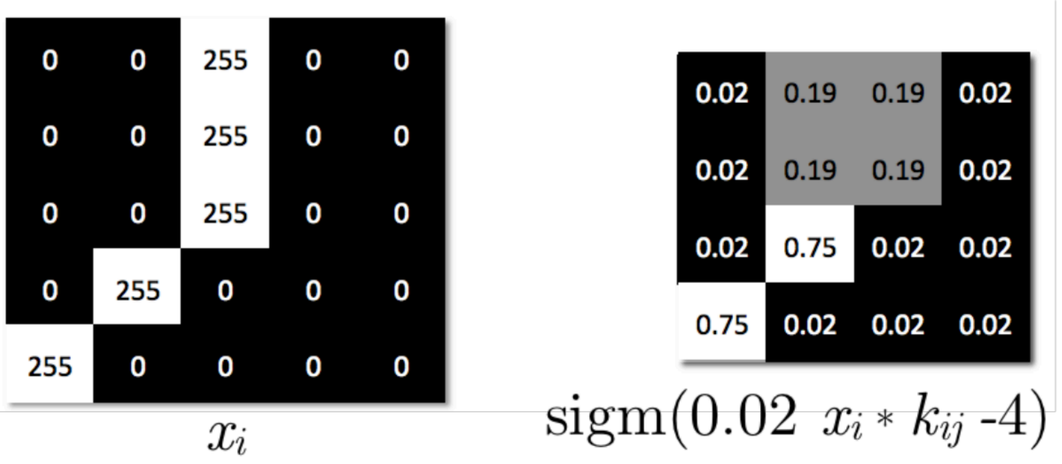
Convolutional Neural Network

Convolution

- Element-wise activation function after convolution
  - ⇒ detector of a feature at any position in the image

$$x * k_{ij}, \quad \text{where } W_{ij} = \tilde{W}_{ij}$$

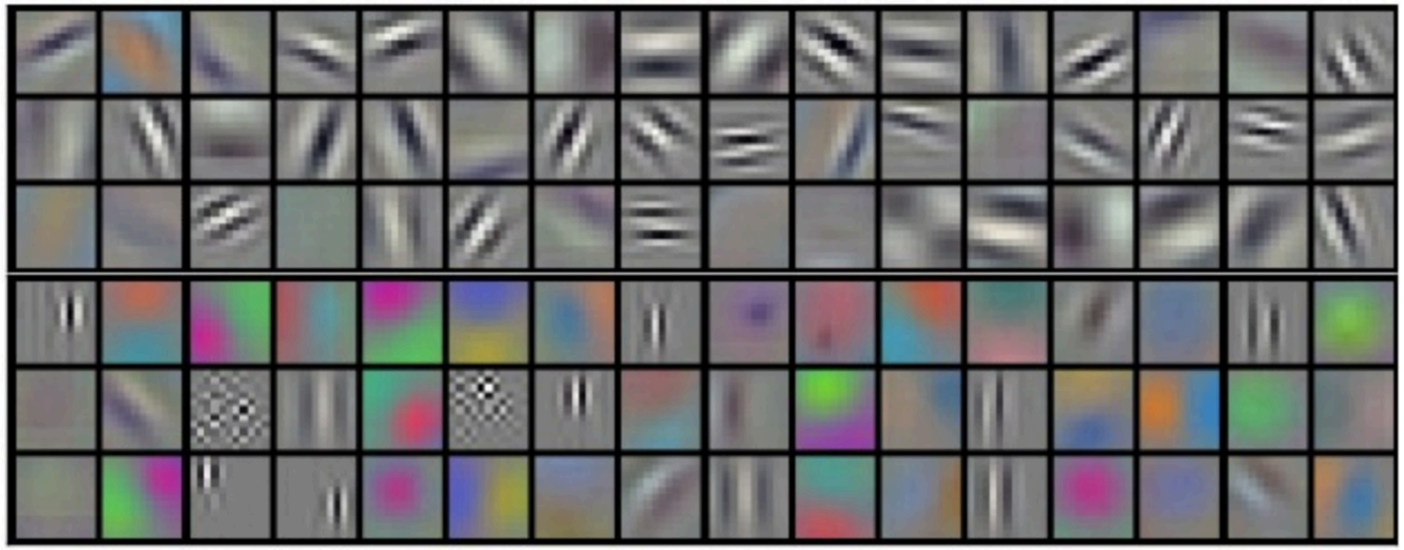




Convolutional Neural Network

Learned Kernels

- Example kernels learned by AlexNet

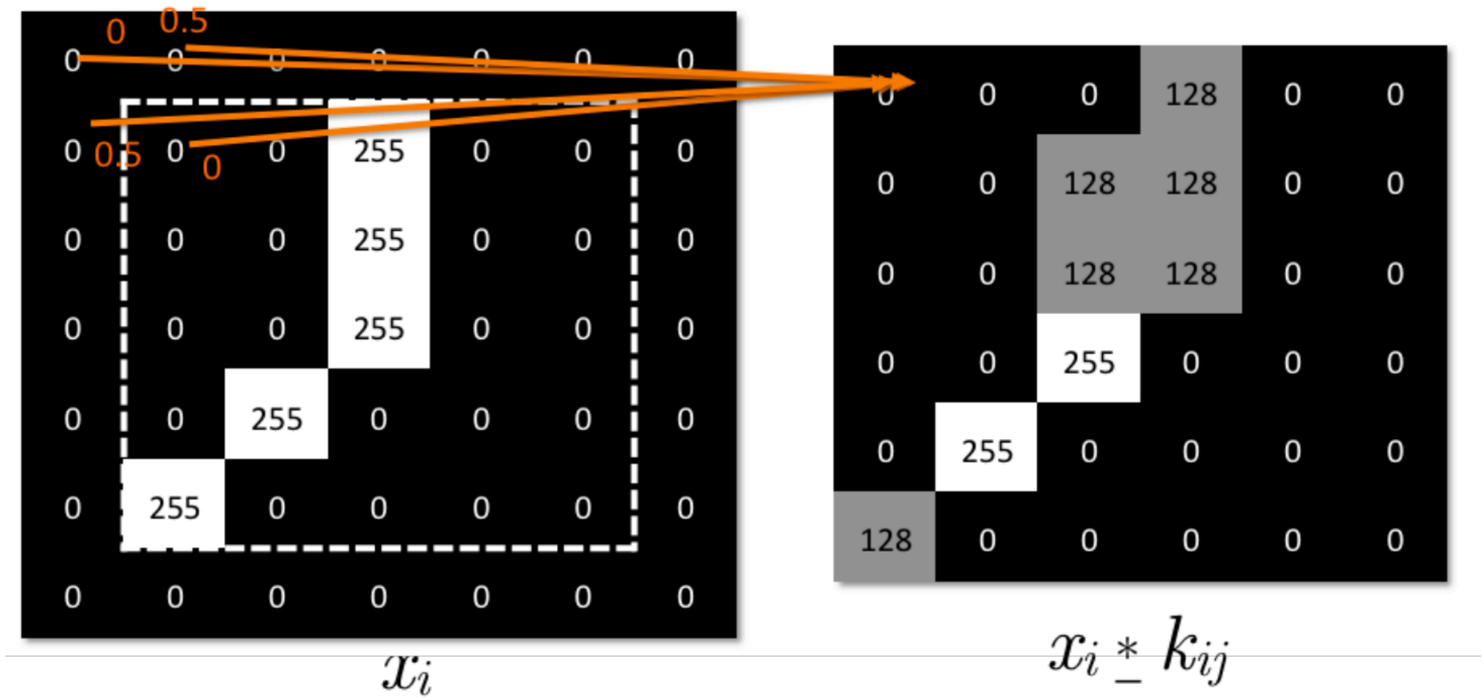


- Number of parameters:
  - Example: 200×200 image, 100 kernels, kernel size 10×10
  - $\Rightarrow 10 \times 10 \times 100$ = 10K parameters

Convolutional Neural Network

Padding

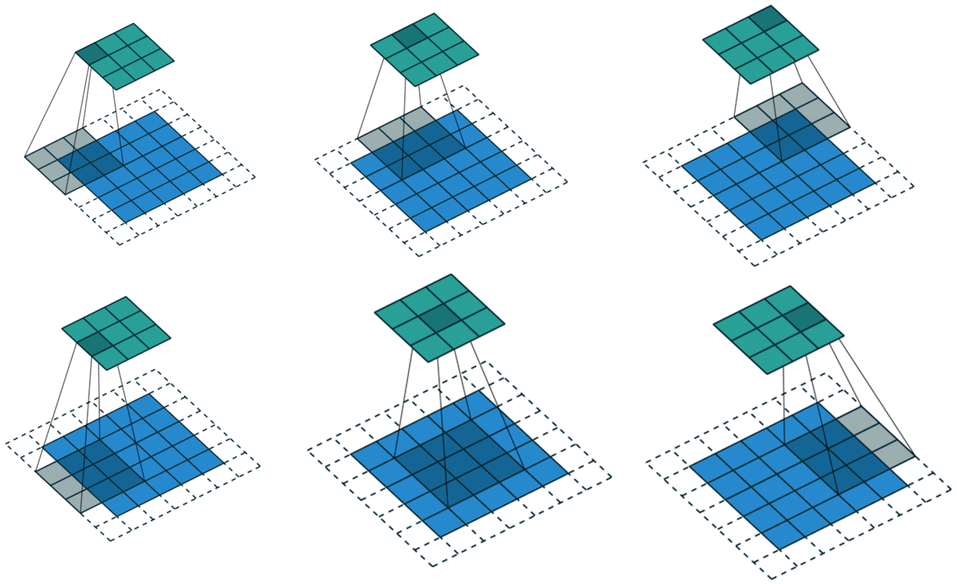
- Use zero padding to allow going over the boundary
  - Easier to control the size of output layer



Convolutional Neural Network

Strides

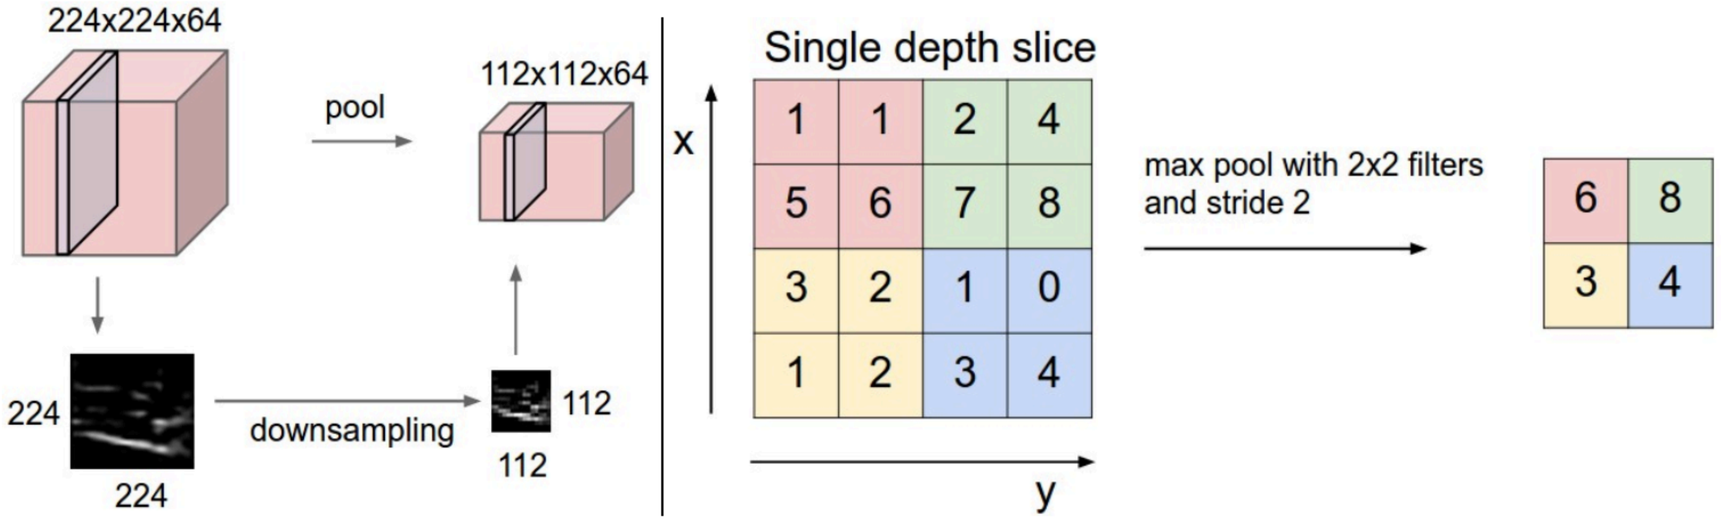
- Stride: The amount of movement between applications of the filter to the input image
- Stride $(1,1)$: no stride



Convolutional Neural Network

Pooling

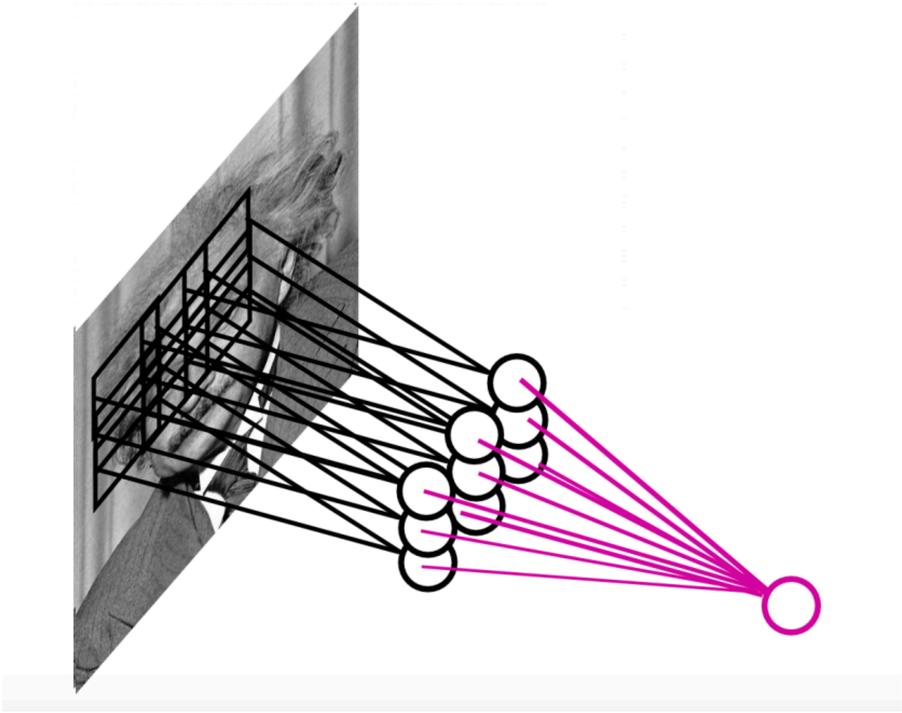
- It’s common to insert a pooling layer in-between successive convolutional layers
- Reduce the size of presentation, down-sampling
- Example: Max pooling



Convolutional Neural Network

Pooling

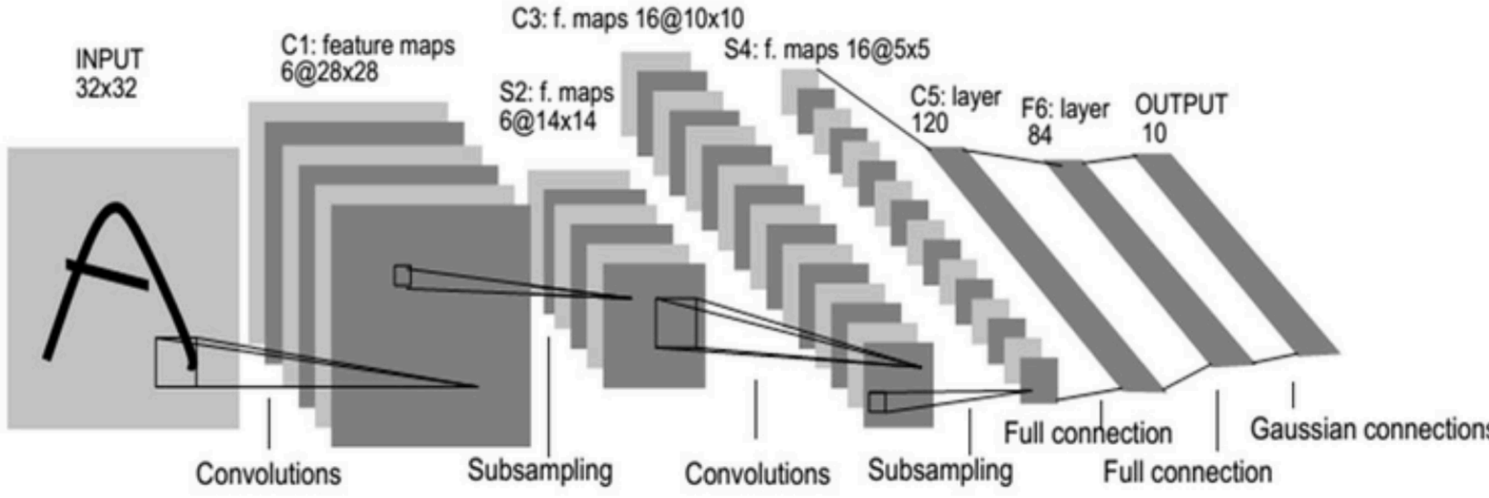
- By pooling, we gain robustness to the exact spatial location of features



Convolutional Neural Network

Example: LeNet5

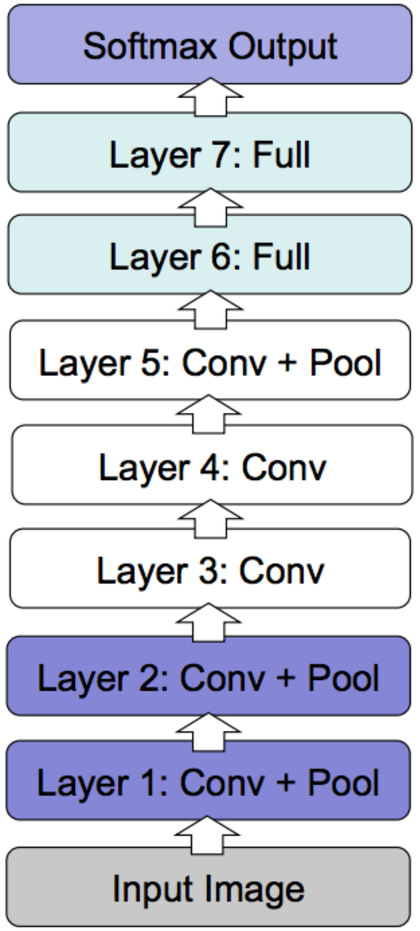
- Input: 32×32 images (MNIST)
- Convolution 1: 6 5×5filters, stride 1
  - Output: 6 28×28 maps
- Pooling 1: 2×2 max pooling, stride 2
  - Output: 6 14×14 maps
- Convolution 2: 16 5×5 filters, stride 1
  - Output: 16 10×10 maps
- Pooling 2: 2×2 max pooling with stride 2
  - Output: 16 5×5 maps (total 400 values)
- 3 fully connected layers: $120 \Rightarrow 84 \Rightarrow 10$ neurons



Convolutional Neural Network

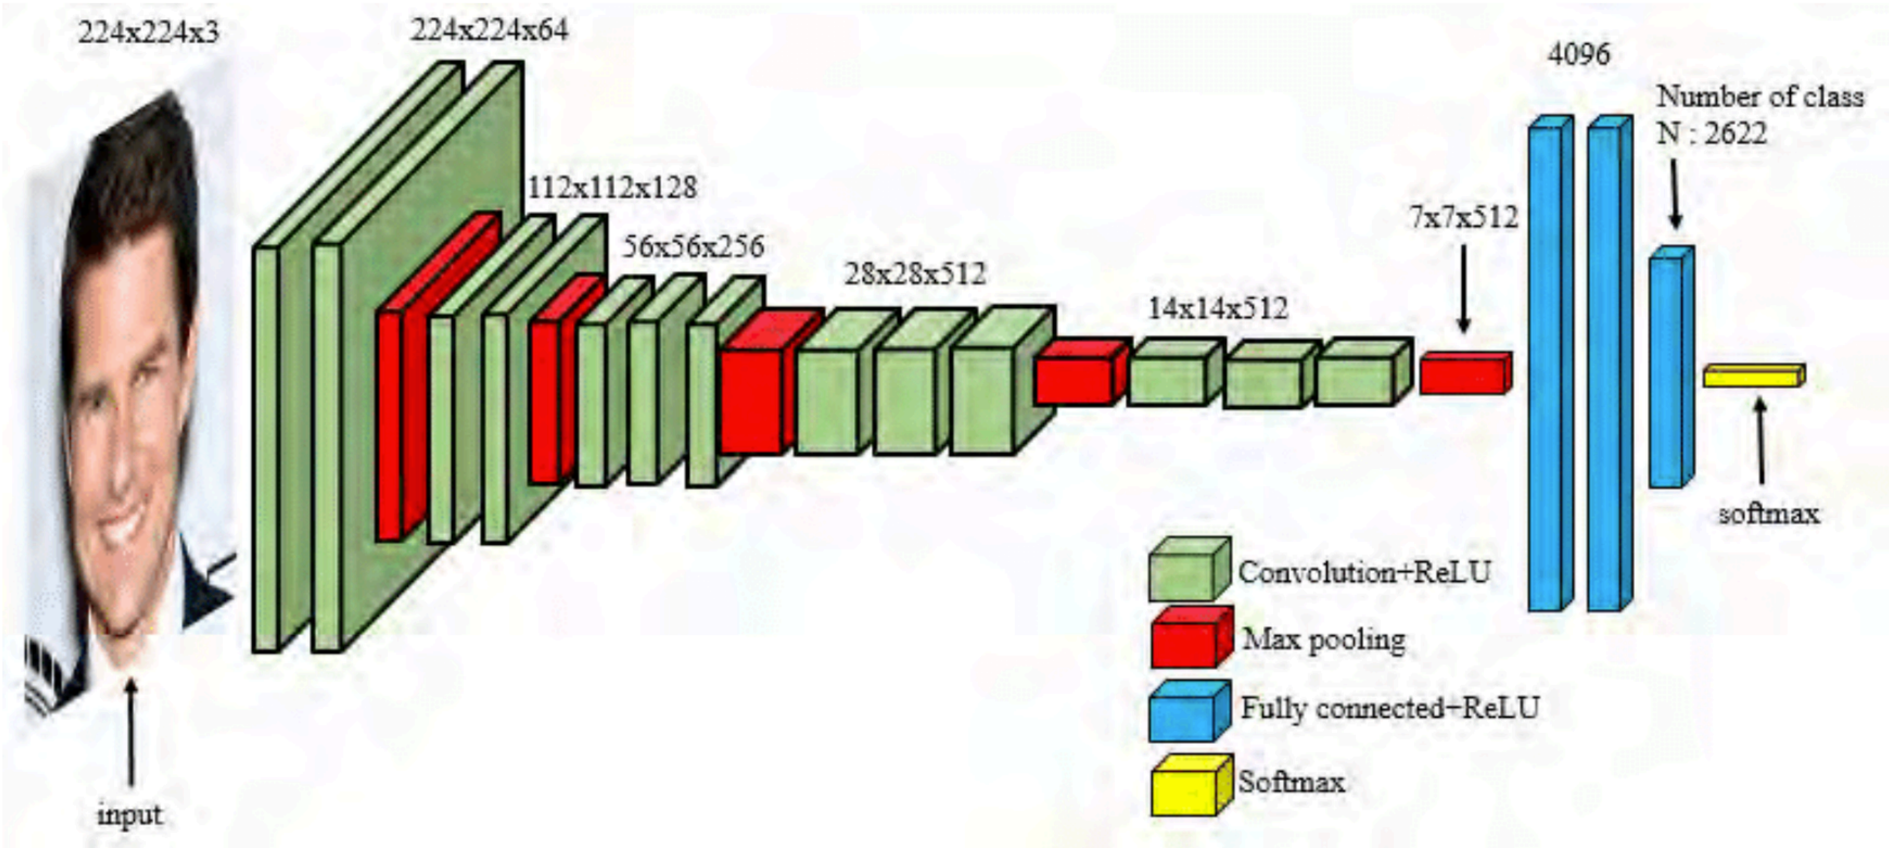
AlexNet

- 8 layers in total, about 60 million parameters and 650,000 neurons.
- Trained on ImageNet dataset
- 18.2% top-5 error
- ``ImageNet Classification with Deep Convolutional Neural Networks'', by Krizhevsky, Sustskever and Hinton, NIPS 2012.



Convolutional Neural Network

VGG Network



Convolutional Neural Network

VGG Network

- Output provides an estimate of the conditional probability of each class

```

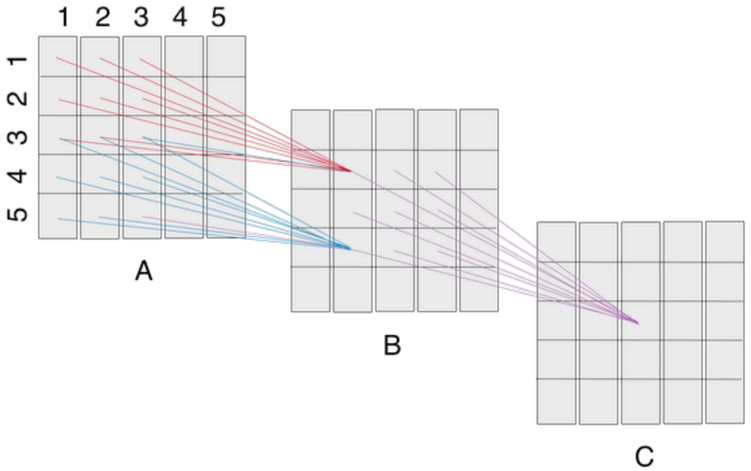
FC: [1x1x1000]  memory:  1000 weights: 4096*1000 = 4,096,000
```

Convolutional Neural Network

What do the filters learn?

- The receptive field of a neuron is the input region that can affect the neuron's output
- The receptive field for a first layer neuron is its neighbors (depending on kernel size) ⇒ capturing very local patterns
- For higher layer neurons, the receptive field can be much larger ⇒ capturing global patterns



Convolutional Neural Network

Training

- Training:
  - Apply SGD to minimize in-sample training error
  - Backpropagation can be extended to convolutional layer and pooling layer to compute gradient!
  - Millions of parameters ⇒ easy to overfit

Convolutional Neural Network

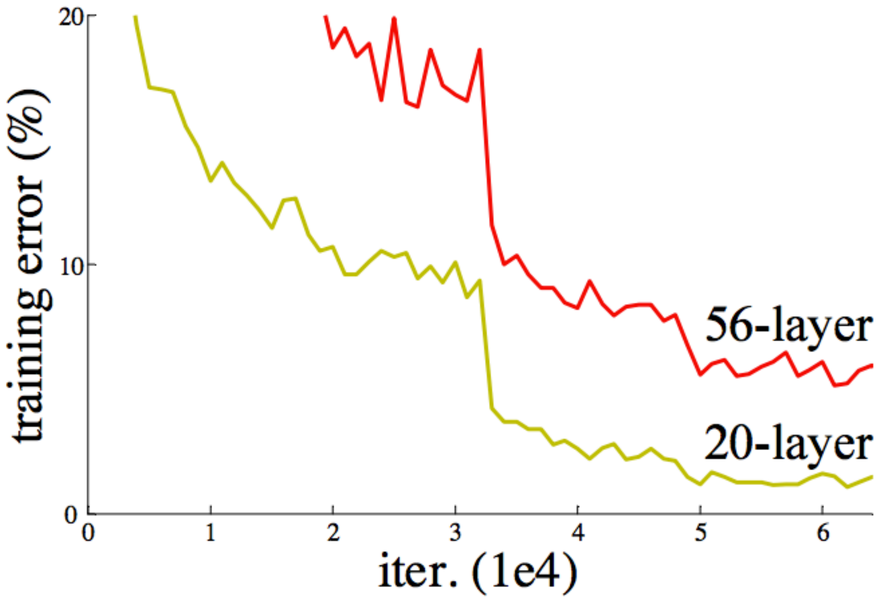
Revisit Alexnet

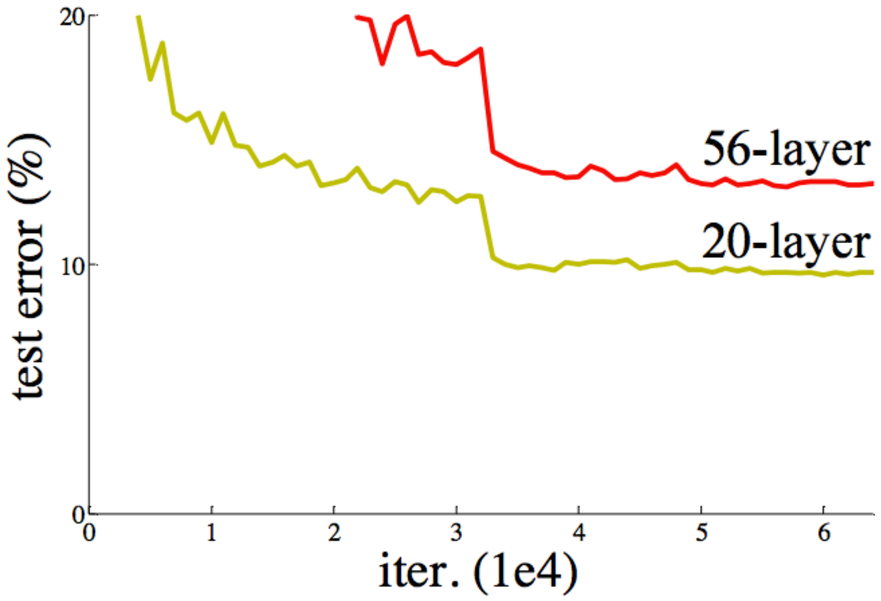
- Dropout: 0.5 (in FC layers)
- A lot of data augmentation
- Momentum SGD with batch size 128, momentum factor 0.9
- L2 weight decay (L2 regularization)
- Learning rate: 0.01, decreased by 10 every time when reaching a stable validation accuracy

Convolutional Neural Network

Residual Networks

- Very deep convnets do not train well —vanishing gradient problem

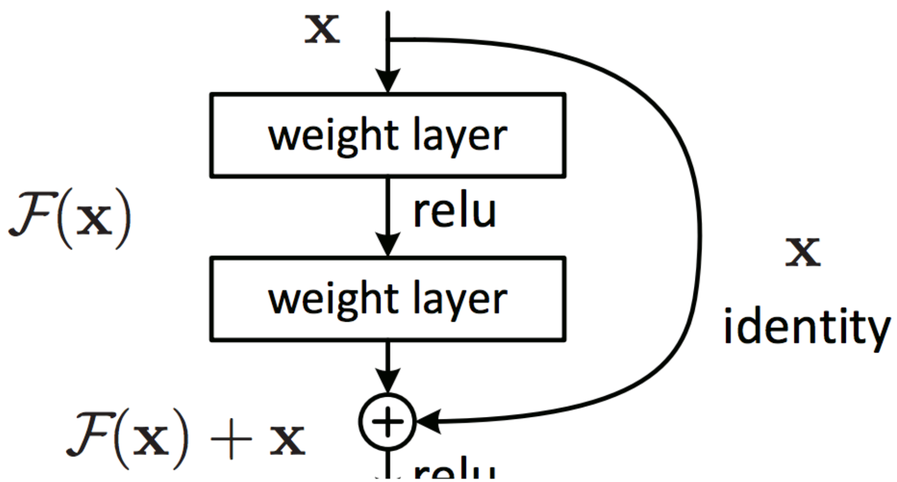




Convolutional Neural Network

Residual Networks

- Key idea: introduce ``pass through'' into each layer



- Thus, only residual needs to be learned

Convolutional Neural Network

Residual Networks
